## 1. Introduction

Online delivery system is created to easy steps to customers to buy something from internet and decrease the time that the customer would take if he wanted to buy something and the variety of items that customer can show or buy in the same time and this system although manage some services like buy and choose item then add to cart and delivery man and bank which customer will buy with own credit card

## 2. Important data and reports

### a. Important data

**Customer:** id,fullname, username,phone number, email,password,address,card,points

**Admin:** id,username

**Delivery person:** is\_activated,username

**Credit card:** number,expiration\_date, cvv\_code

**Delivery:** delivery\_number,delivery\_type,fees,username

**Orders:**

order\_no,order\_date,total\_amount,cash\_amount,credit\_number,payment\_type,order\_status,remaining\_days,time\_limit,customer\_name,delivery\_id,creditcard\_number

**Product:**

serial\_number,product\_number,category,product\_description,price,final\_price,color,available,rate,customer\_username,customer\_order\_id

**Wishlist:** name, username, serial\_no

**Admin\_delivery\_order:** delivery\_username,order\_no,admin\_username,delivery\_win

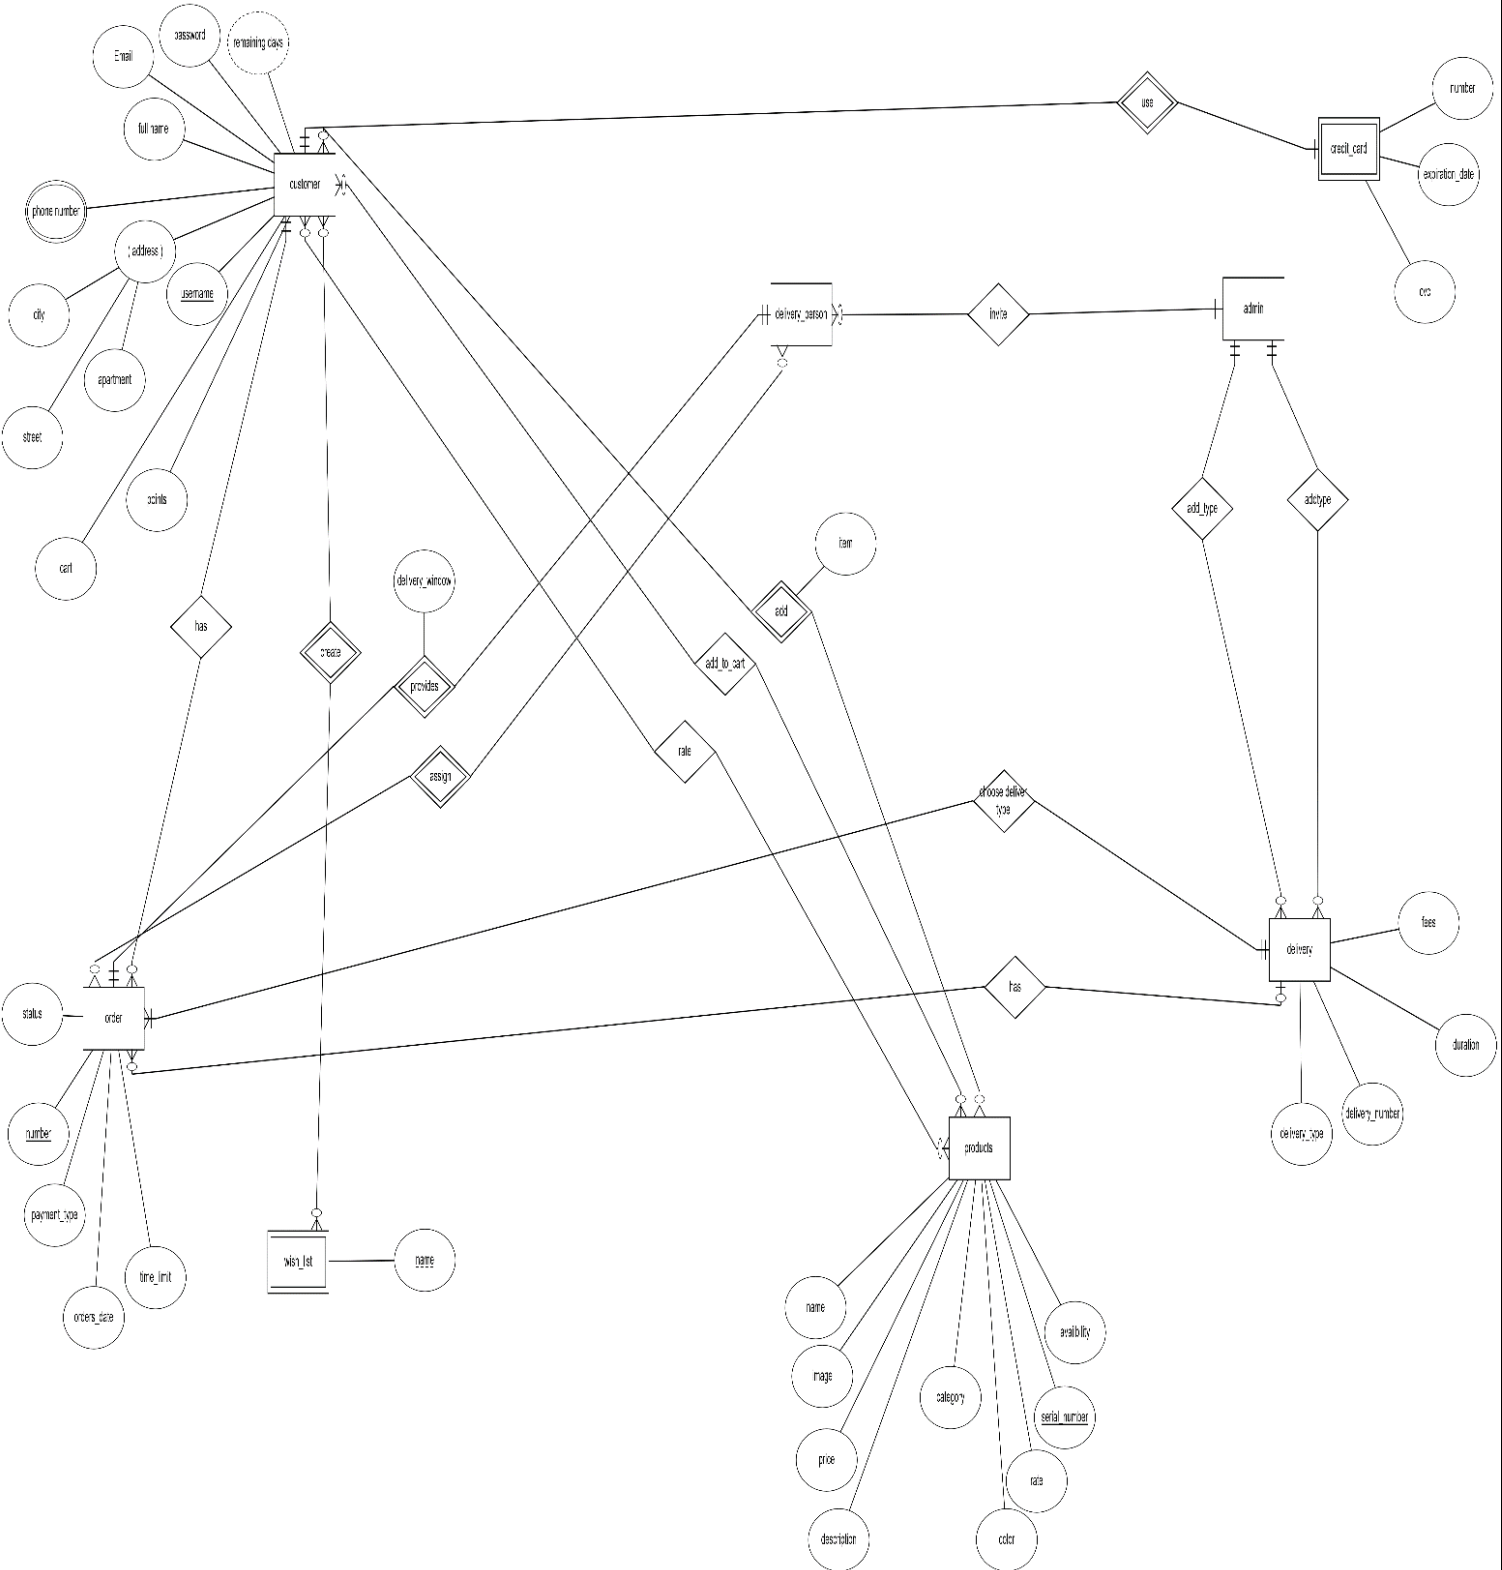

## **b. Reports**

1. get the order management by the customer.
2. get the product selected by the customer.
3. get the order which accepted by admin.
4. get the order confirmation between admin and delivery man.
5. get the order payment chosen by the customer.
6. get the product price discounted from customer`s credit card.
7. get the product color and size chosen by customer.

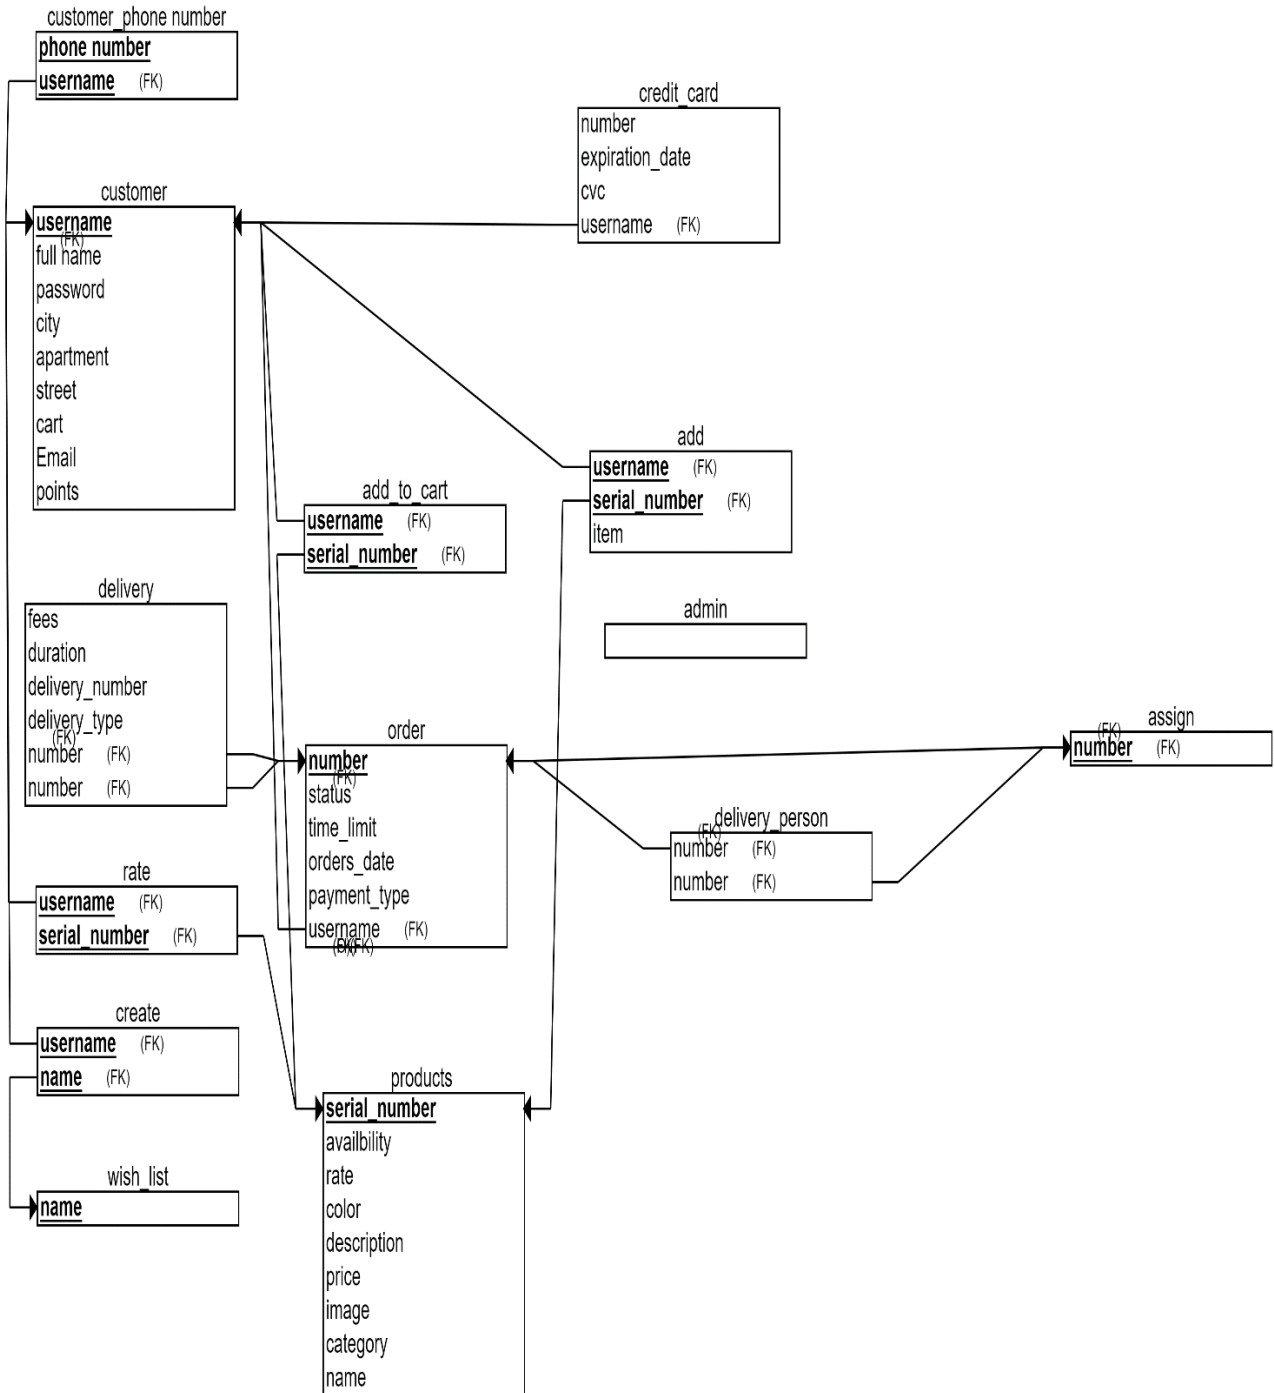

## **3. Assumption**

1. the customer points will increase after buying or ordering variety things.
2. the delivery\_person activation changed if he is not available to deliver order.
3. products fees change from time to time according to currency change.
4. if product is sold out its availability change to sold out where customers cann`t buy it only knowing its info.
5. if the final\_price of the product is greater than the total amount in the customer`s credit card the payment method will be refused and confirmation is at hold until recent time then canceled if the customer did not charge the credit.

#### 4. EER Diagram:

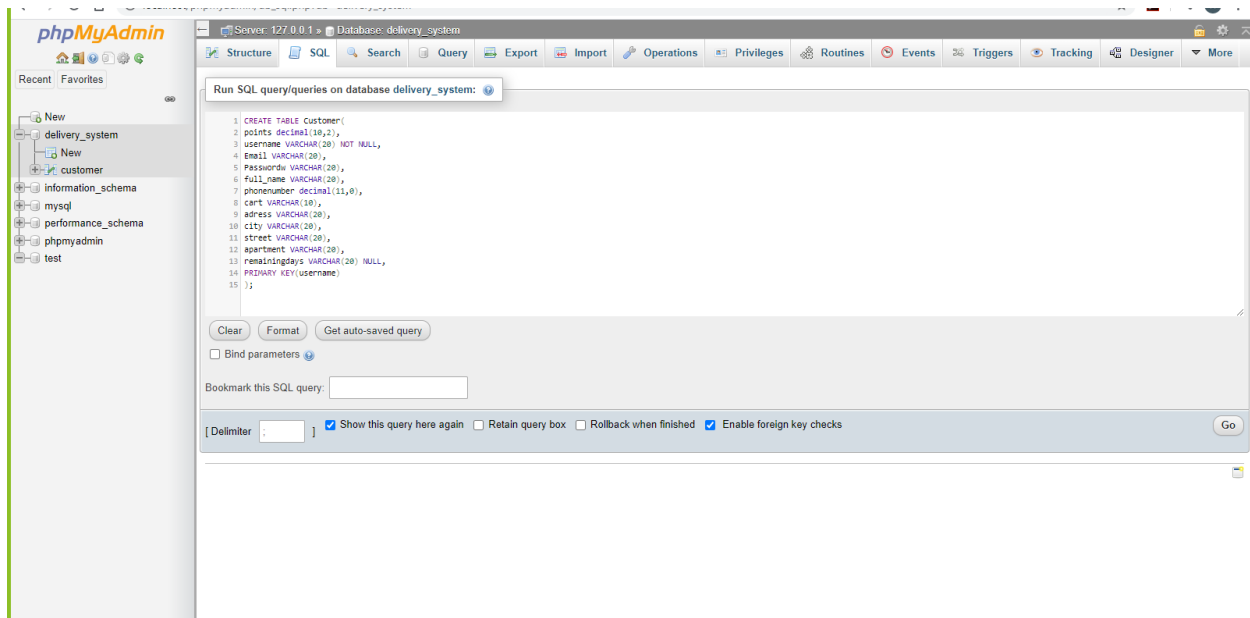

## 5. Database schema:

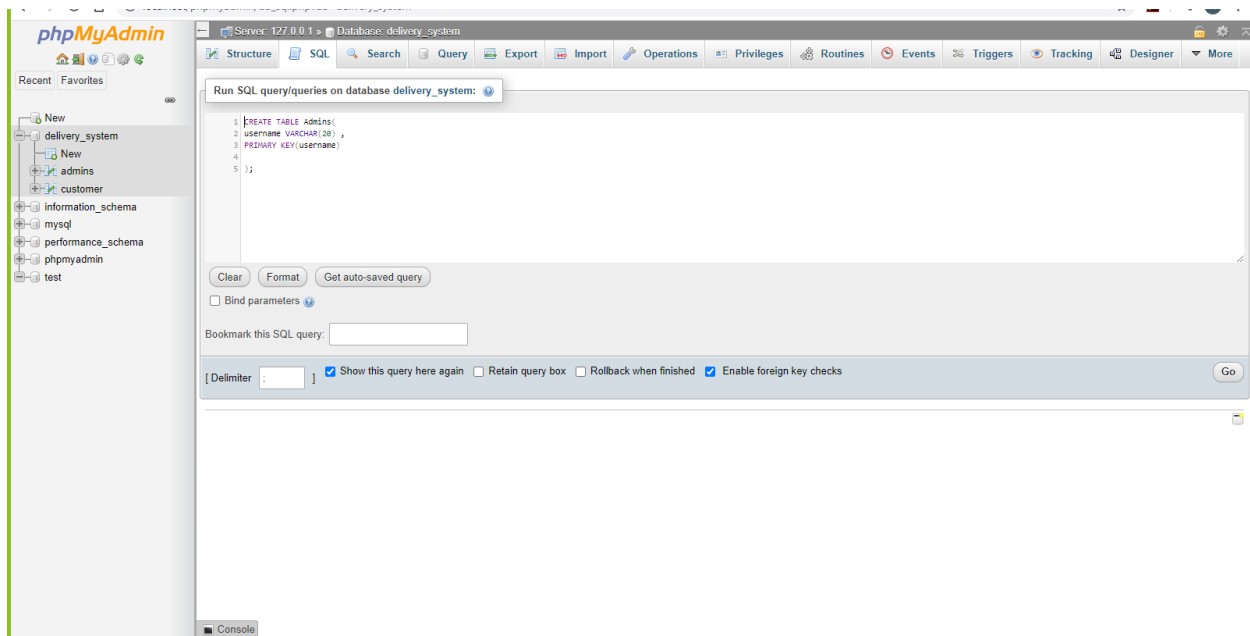

## 6. Sample of SQL:

### a. Sample of created tables

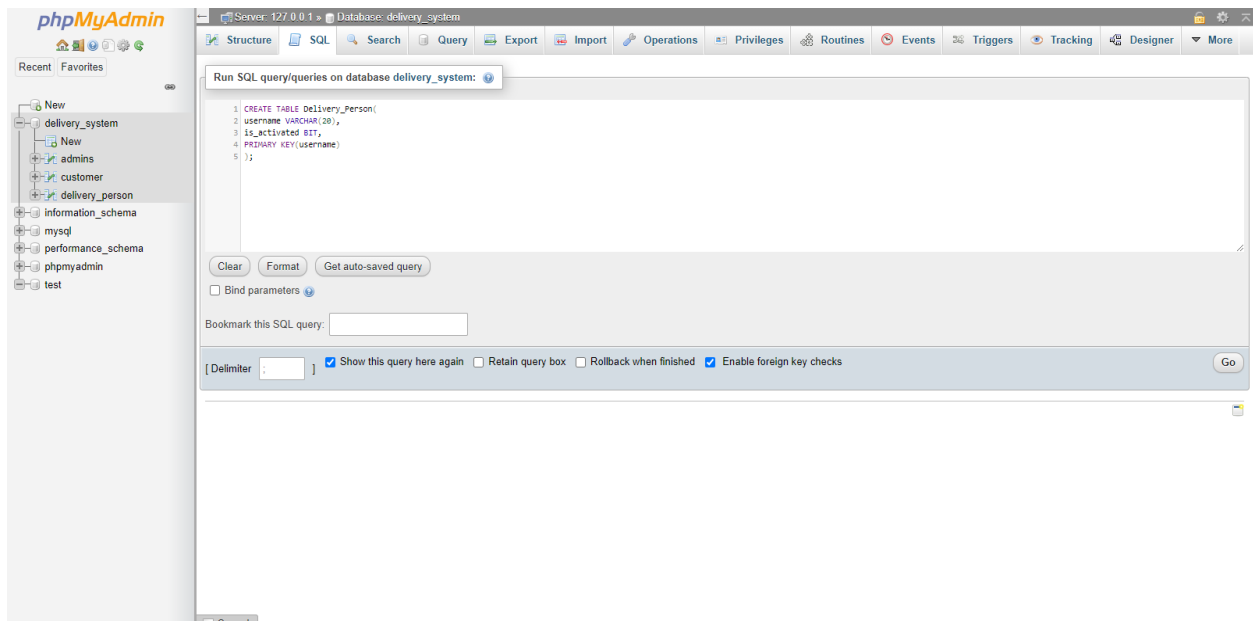

#### i. Customer table

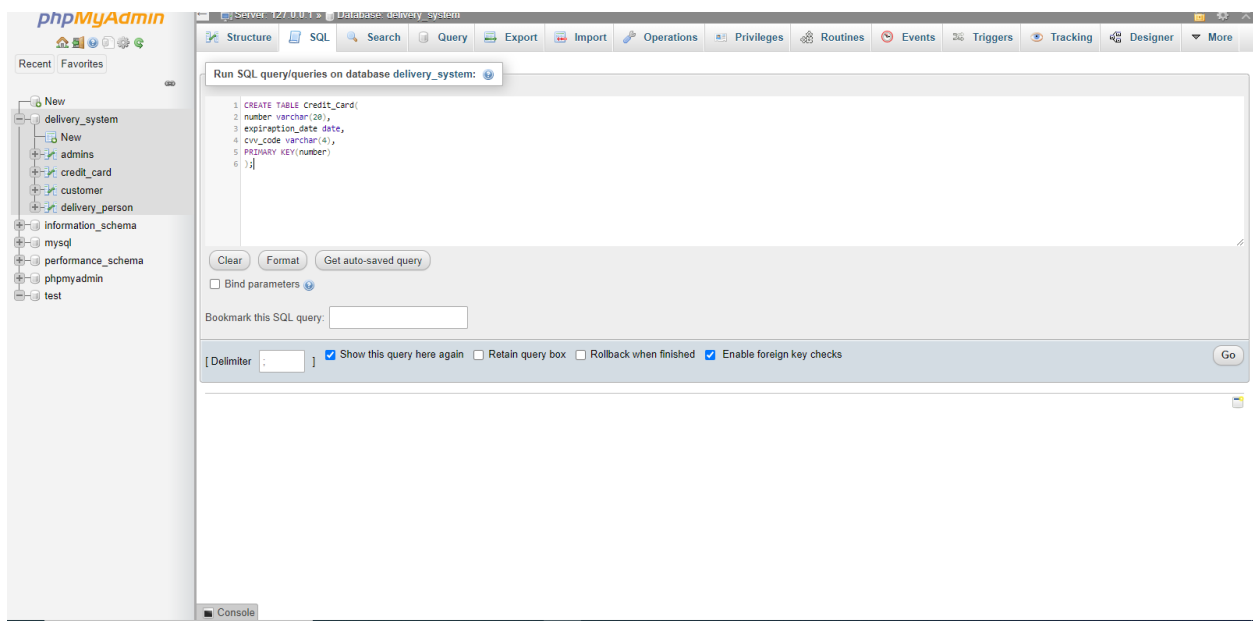

#### ii. Admins table

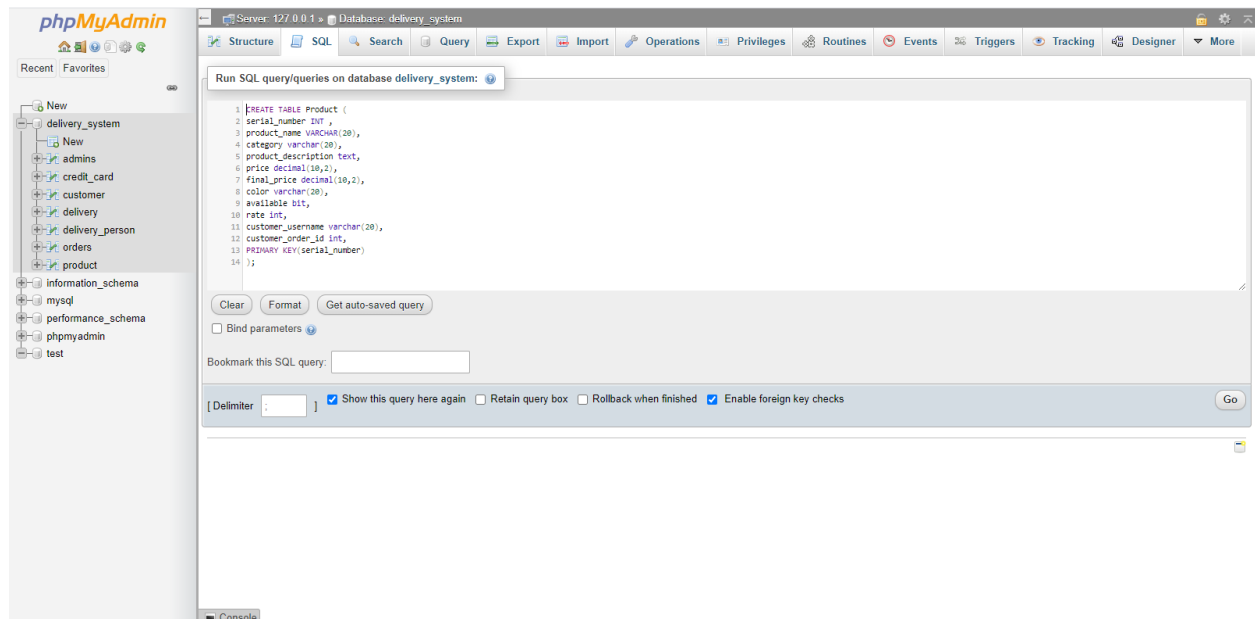

### iii. Delivery\_person table

### iv. Credit\_card table

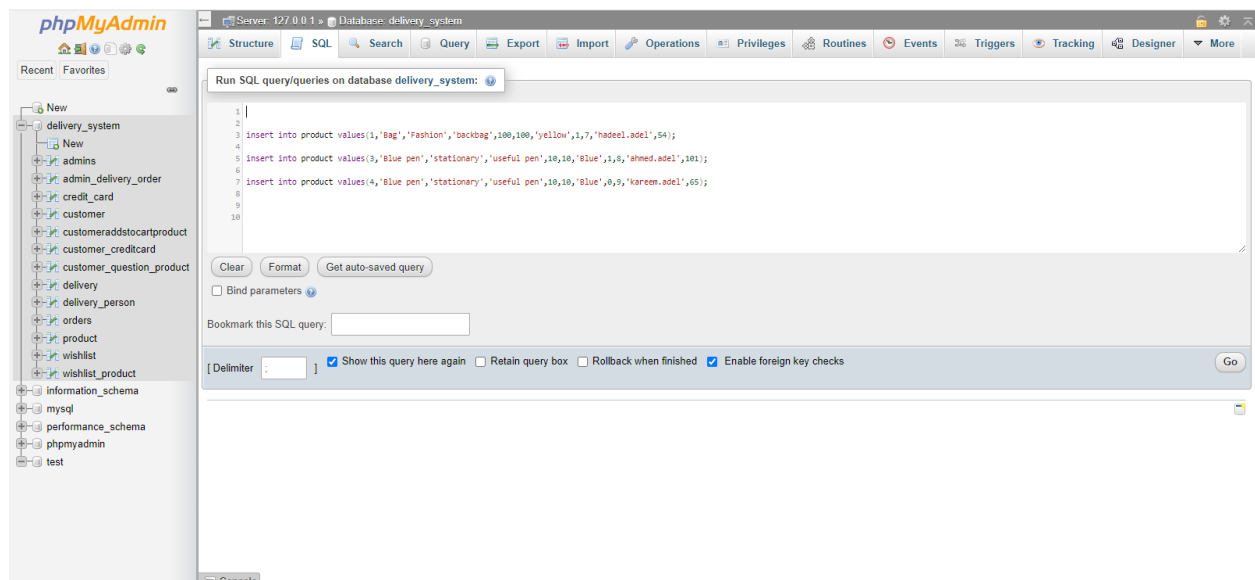

## v. Product table

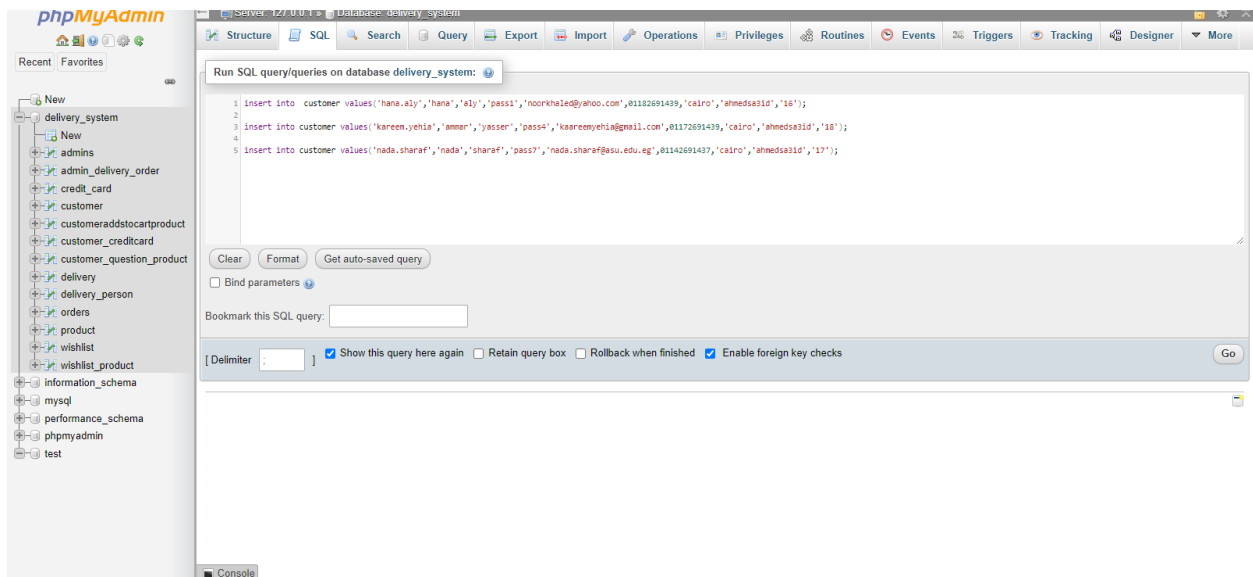

## b. Sample of insert into tables

### i. Insert to product table

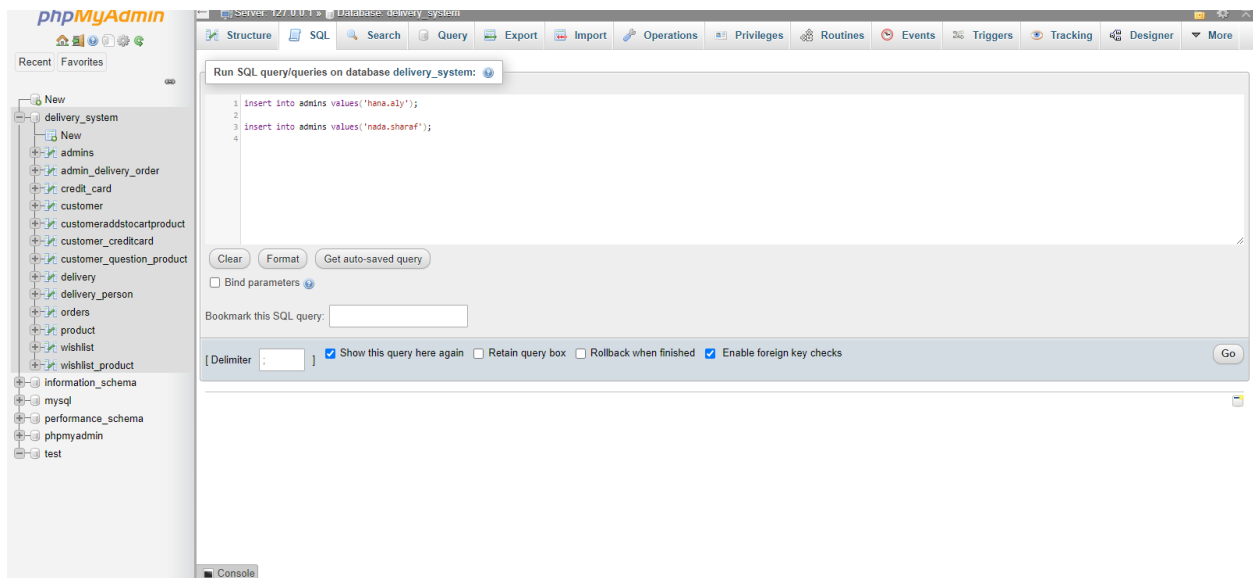

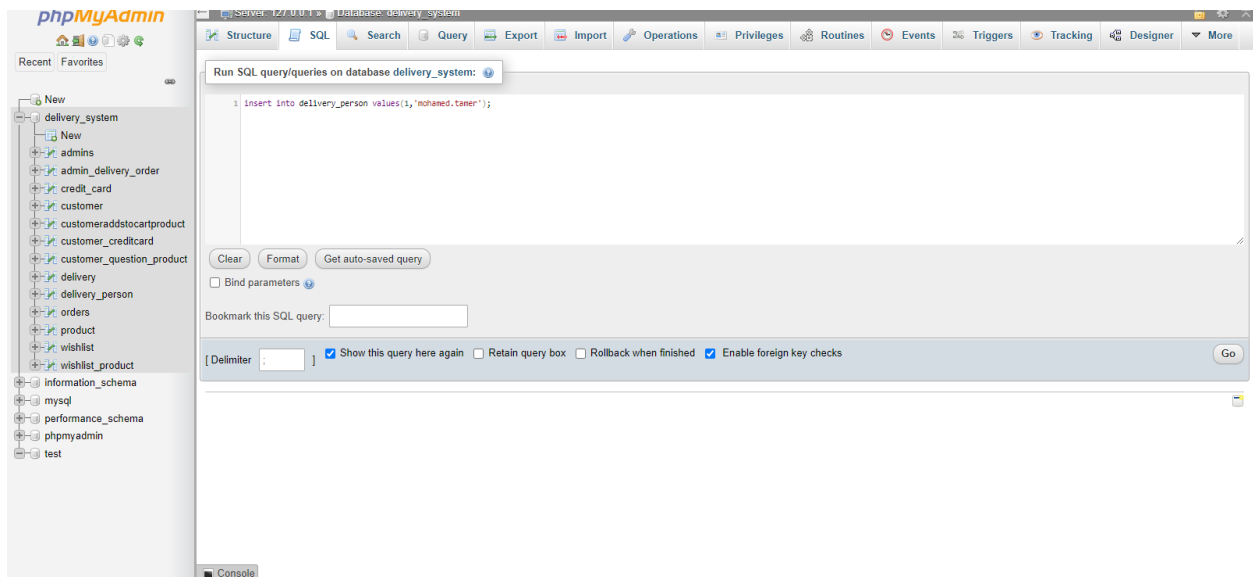

## ii. Insert to customer table

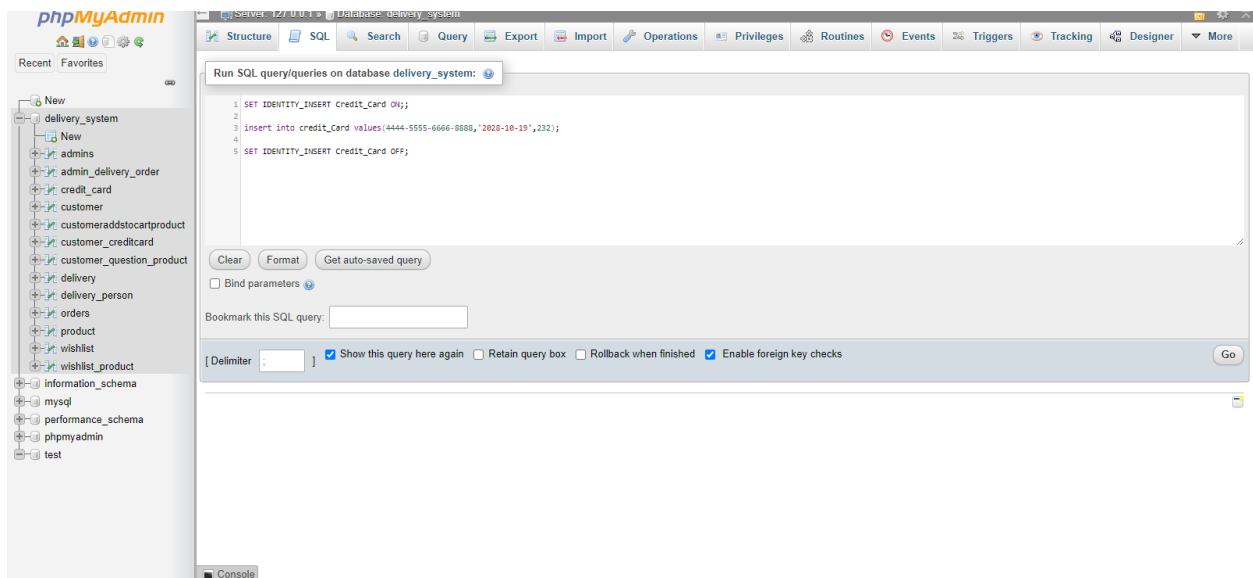

## iii. Insert to admins table

#### iv. Insert to delivery\_person table

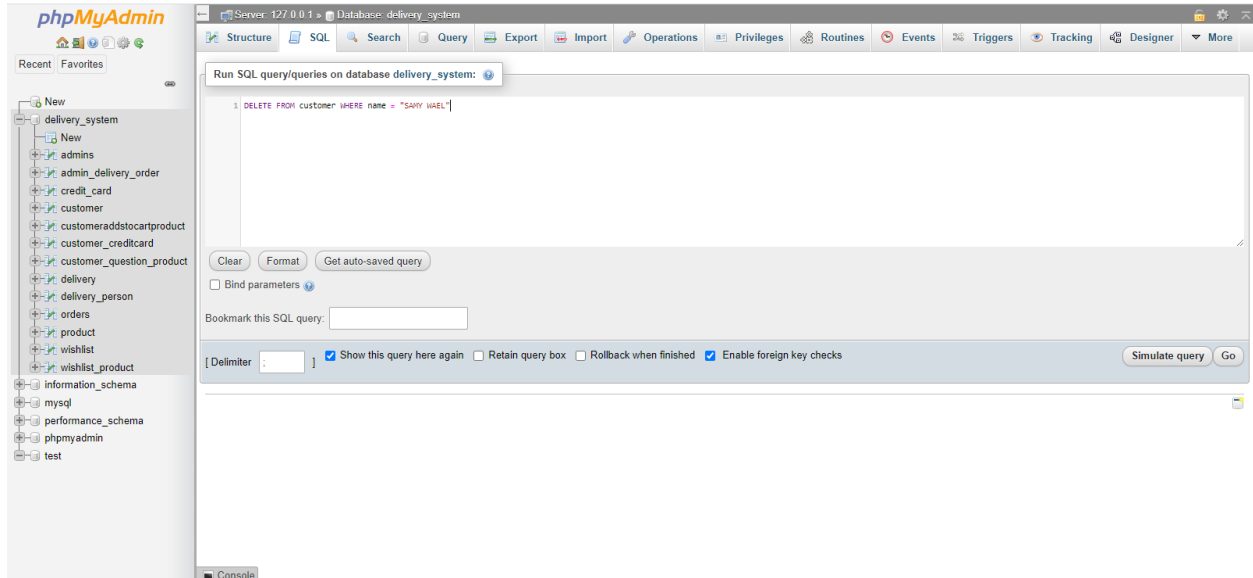

#### v. Insert to credit\_card table

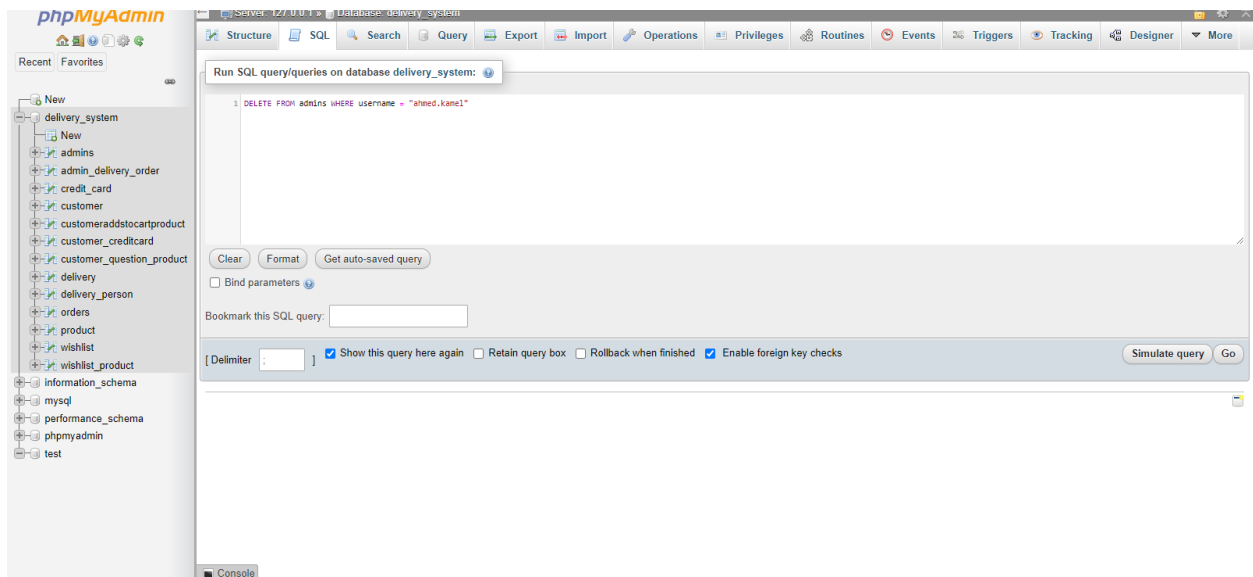

## c. Sample of deleting data from tables

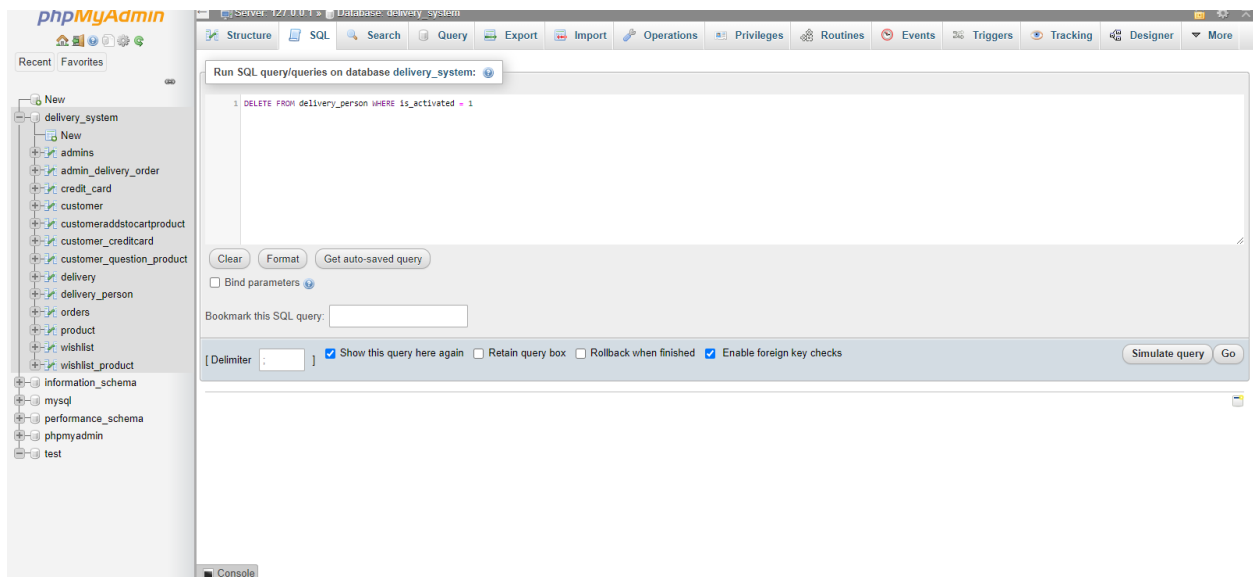

### i. Delete data from customer table

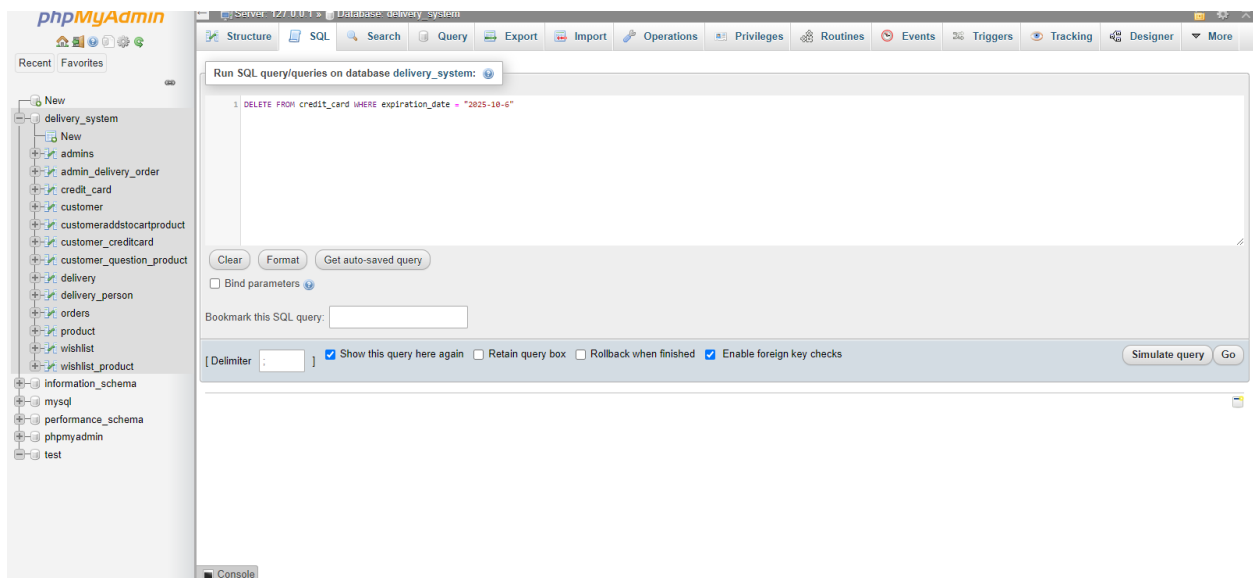

### ii. Delete data from admins table

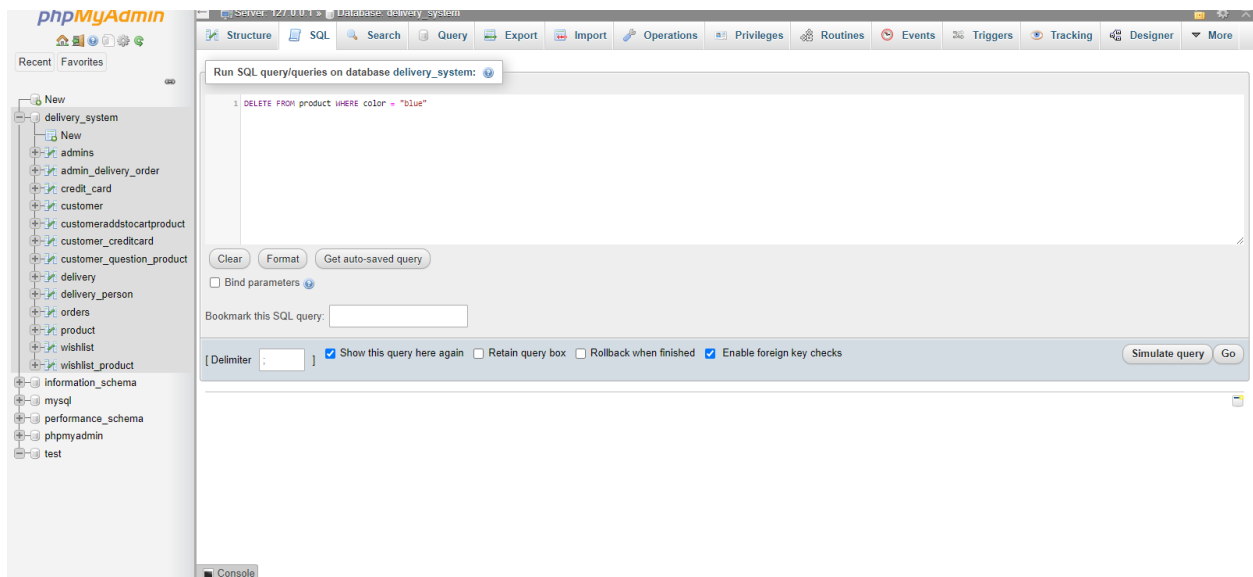

### iii. Delete data from delivery\_person table

### iv. Delete data from credit\_card table

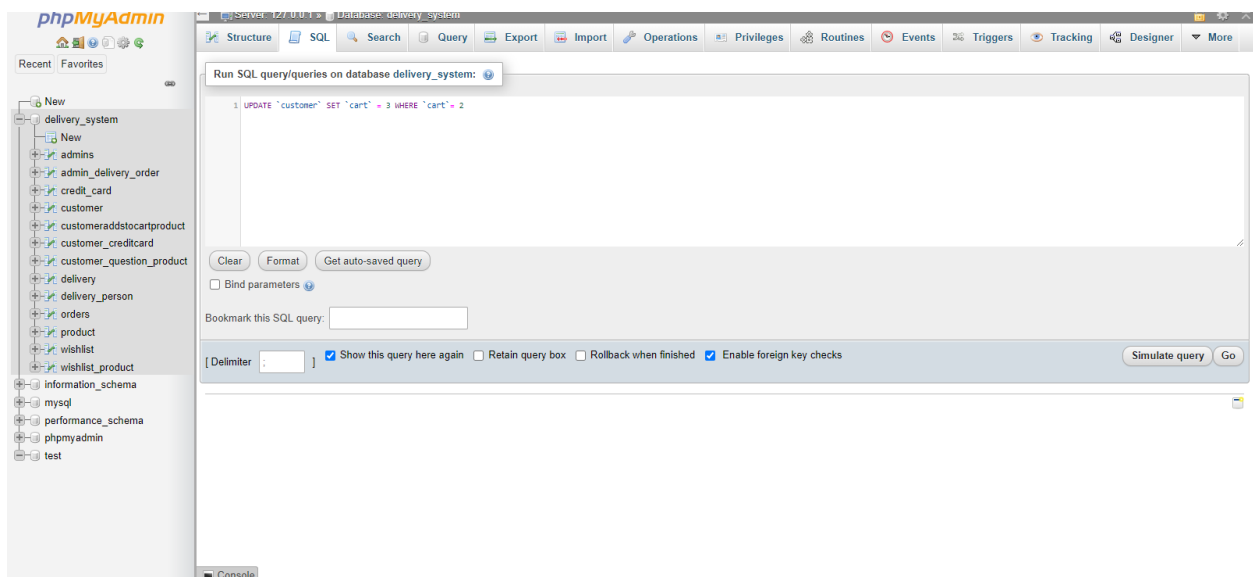

## v. Delete data from product table

## d. Sample update data in tables

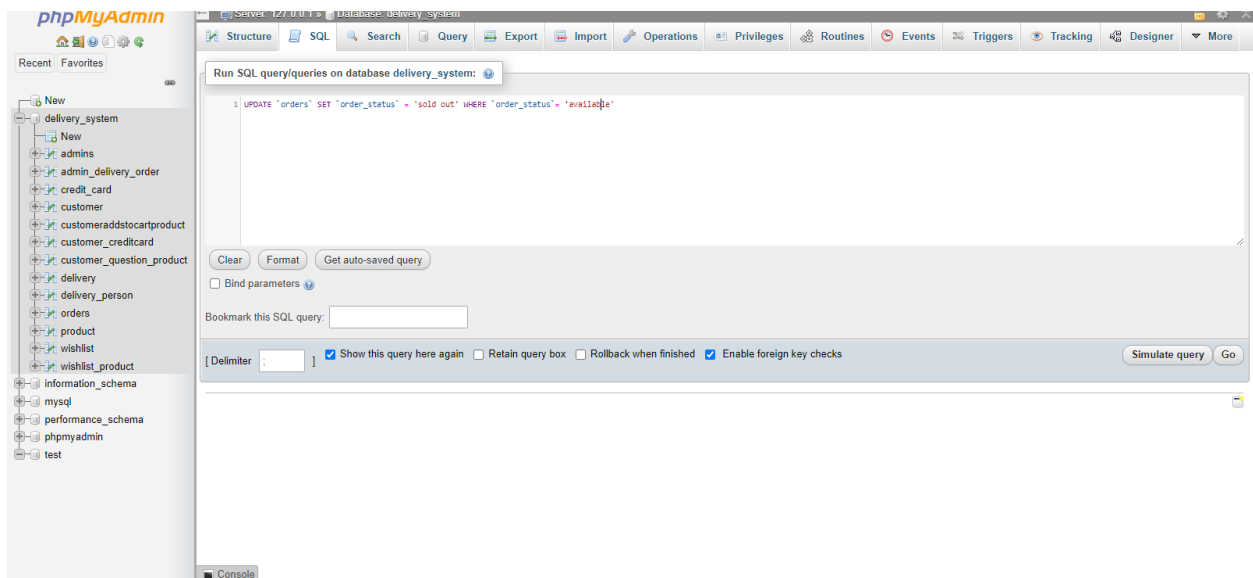

### i. Update customer cart no. to be 3 instead of 2

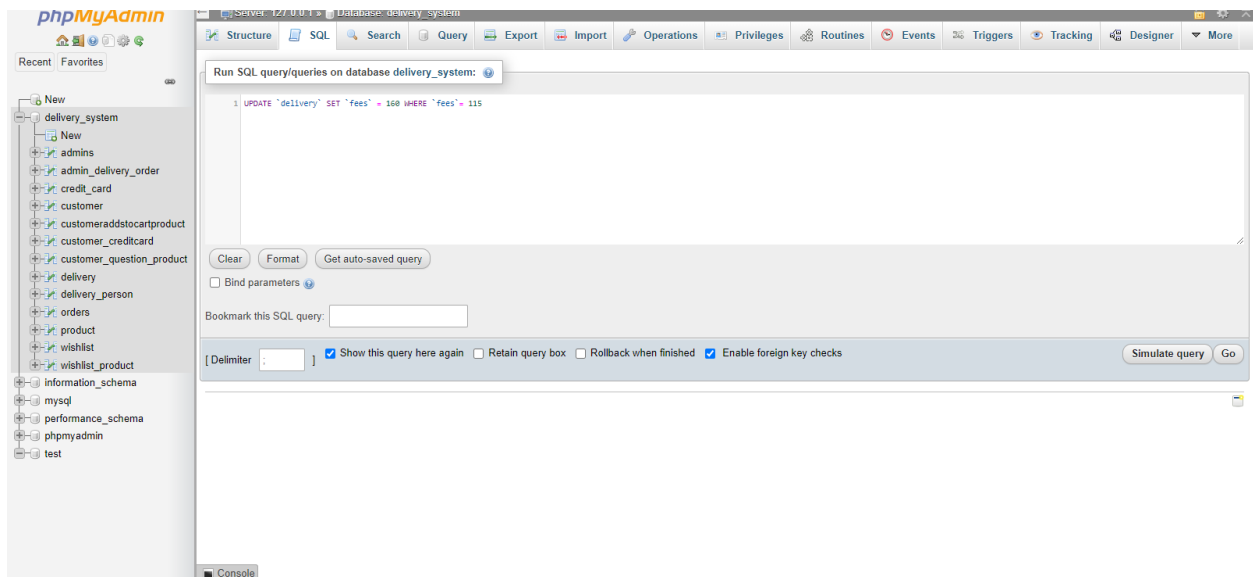

## ii. Update product price to be 1500 instead of 1200

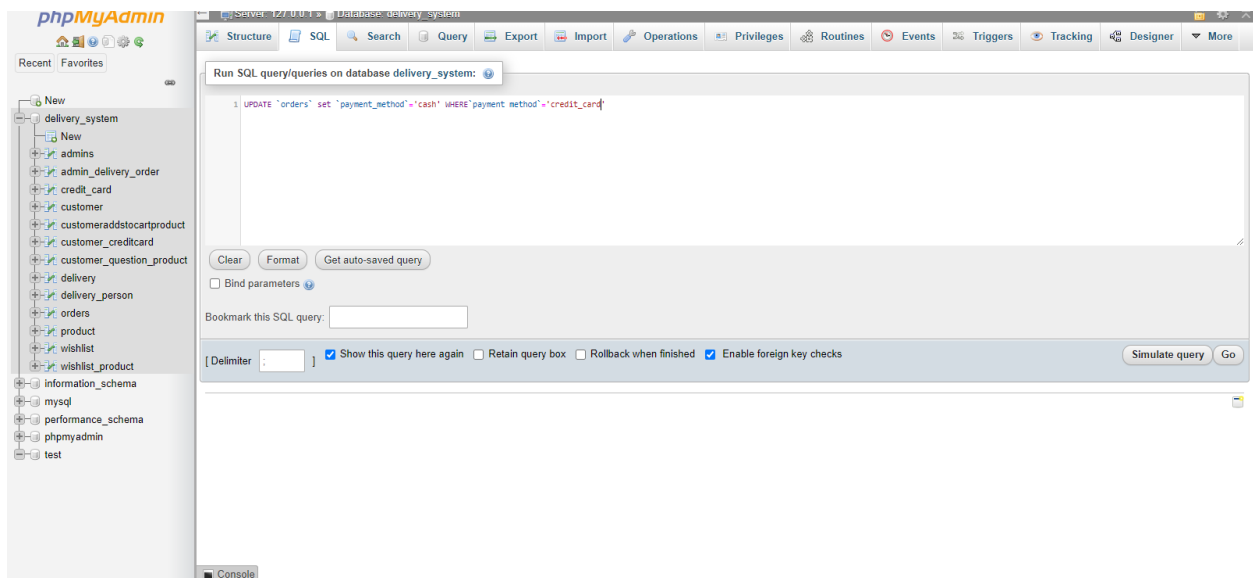

## iii. Update order\_status to be sold\_out instead of available

#### iv. Update delivery fees to be 160 instead of 115

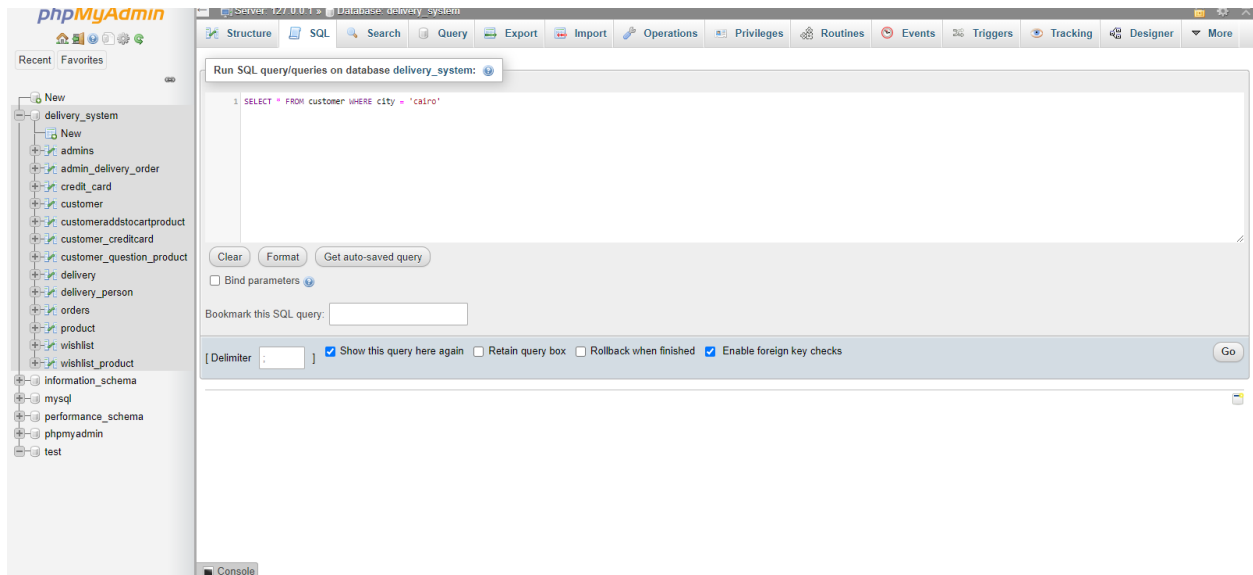

#### v. Update orders payment method to be cash instead of credit\_card

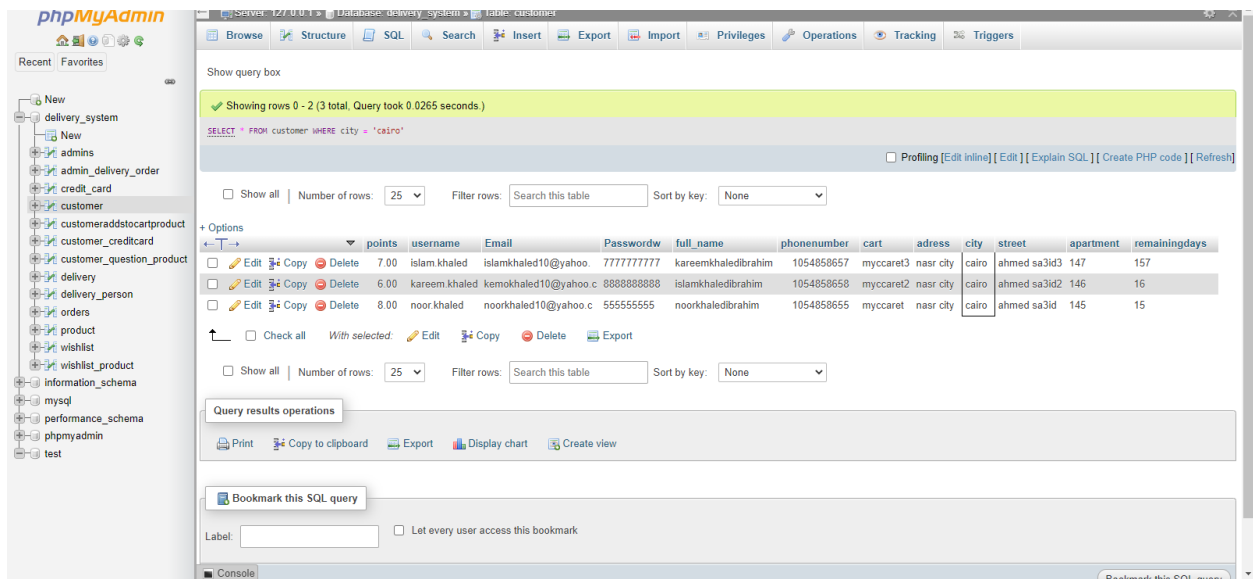

## e. Sample of select data from table

### i. Select customers from Cairo city

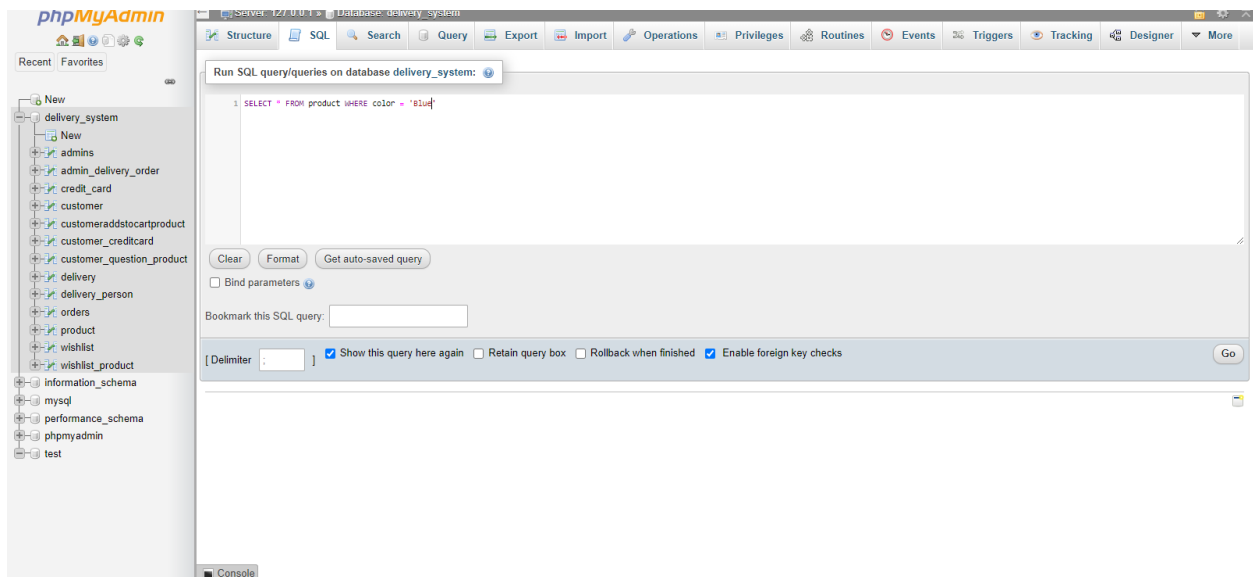

## Selection

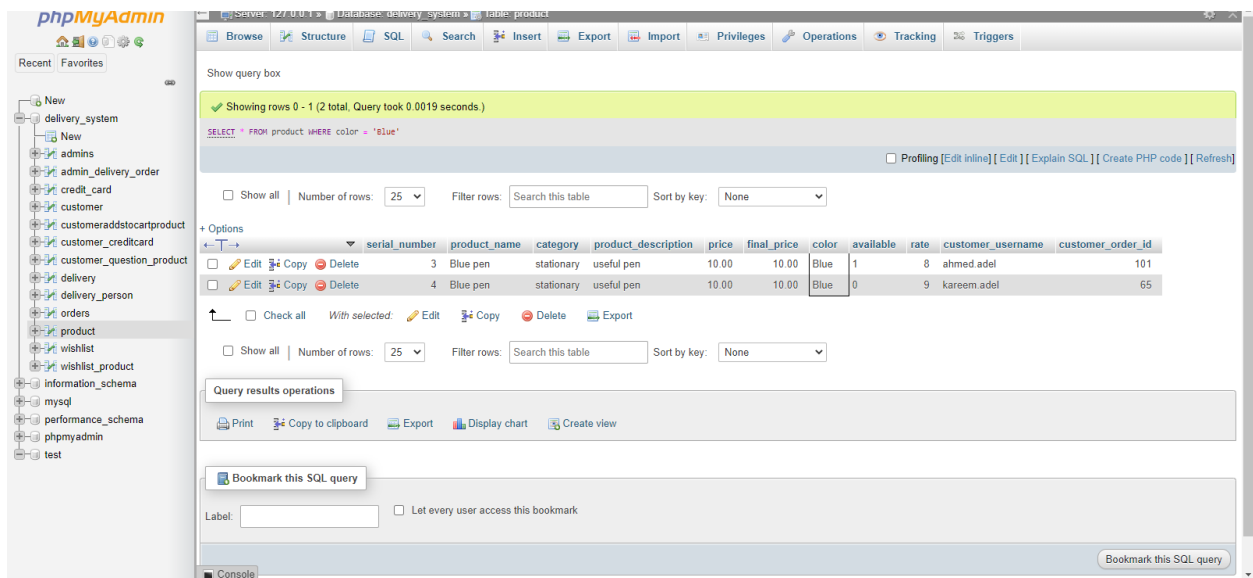

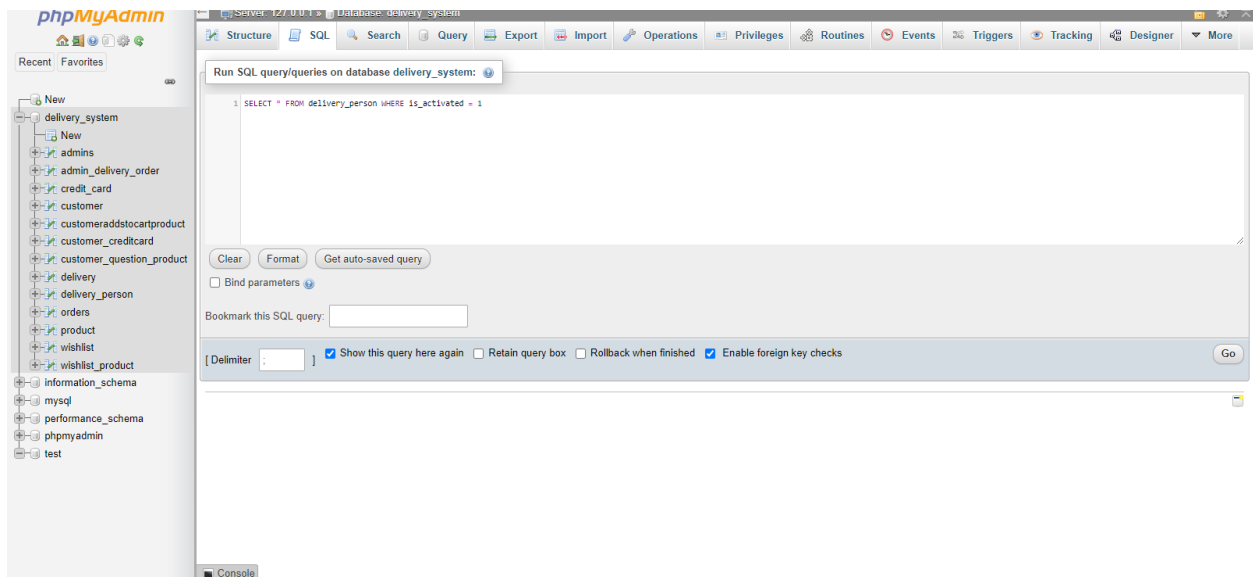

## ii. Select blue product color

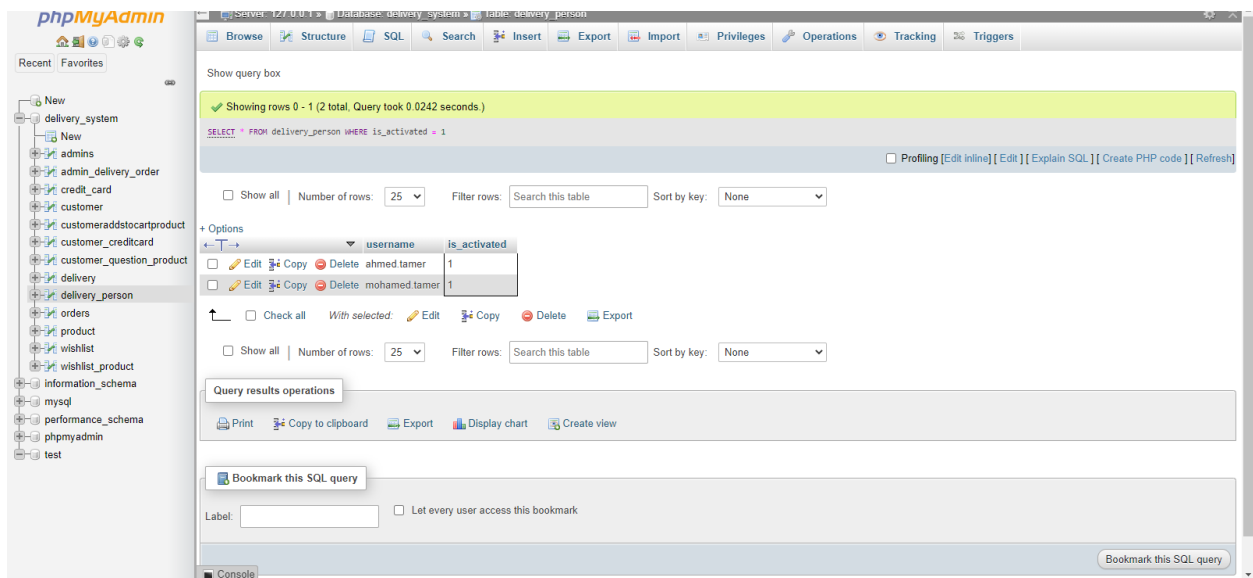

## Selection

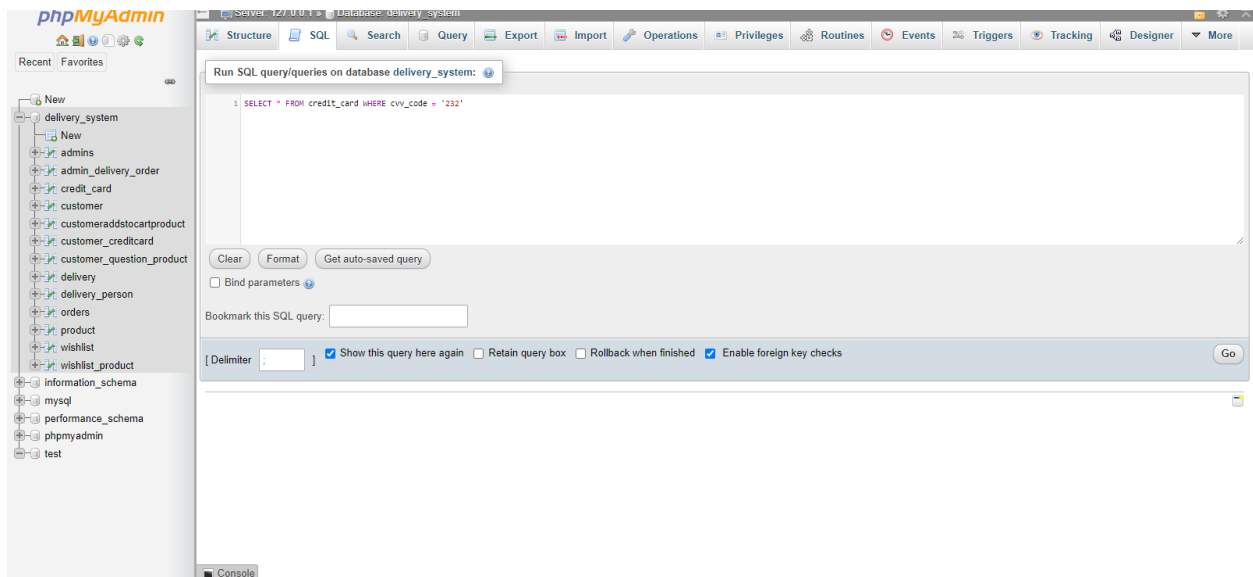

### iii. Select is\_activated = 1 delivery\_person

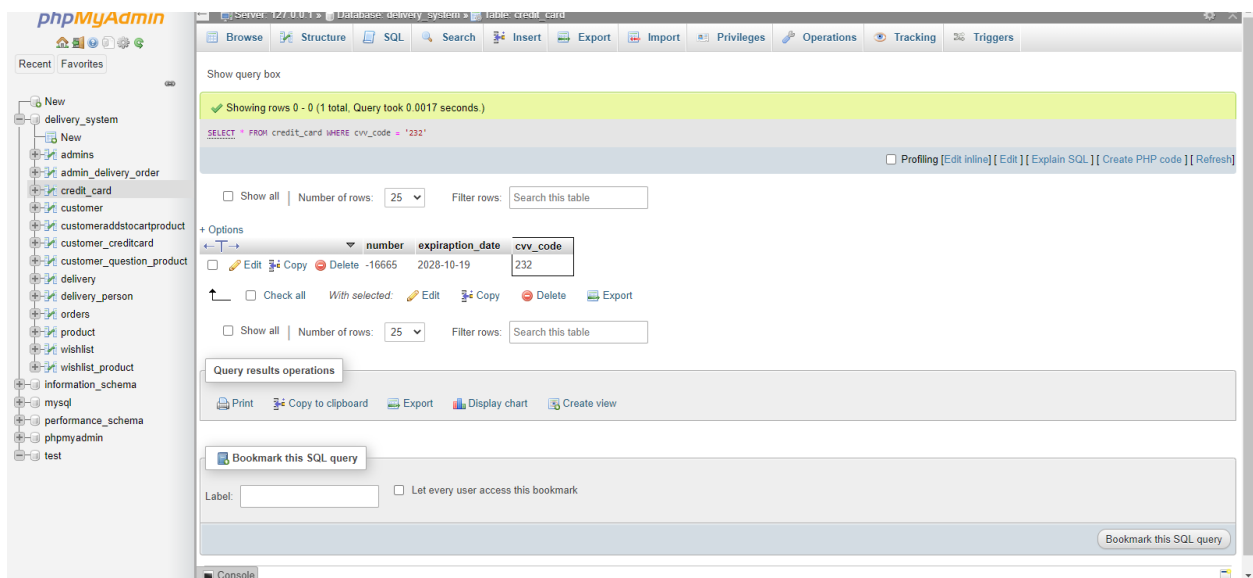

## Selection

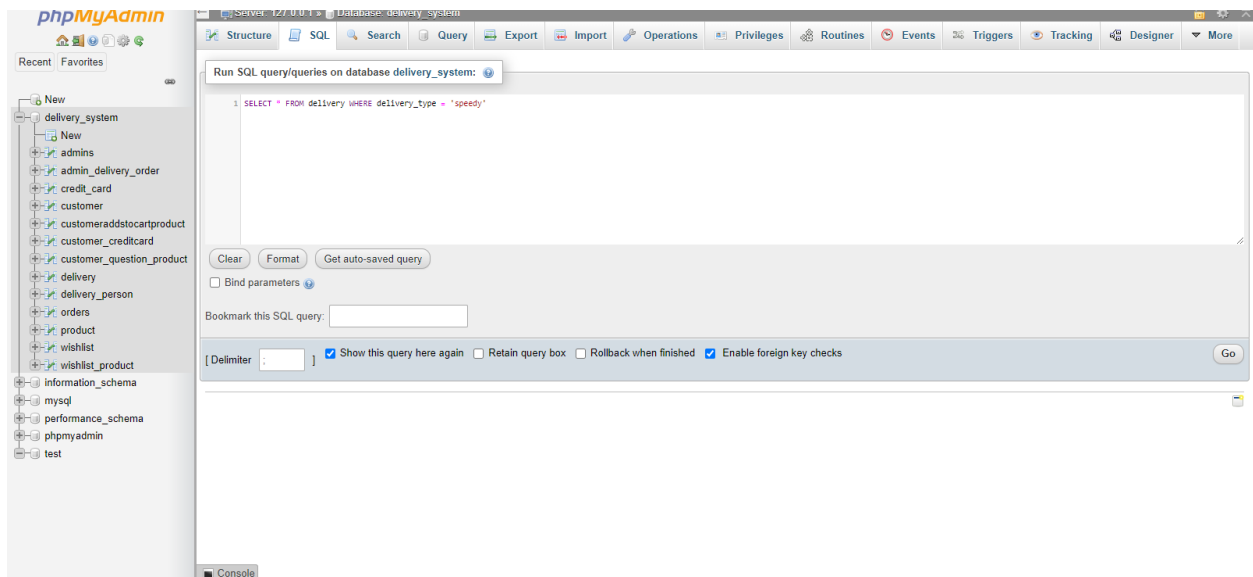

#### iv. Select cvv = 232 from credit\_card

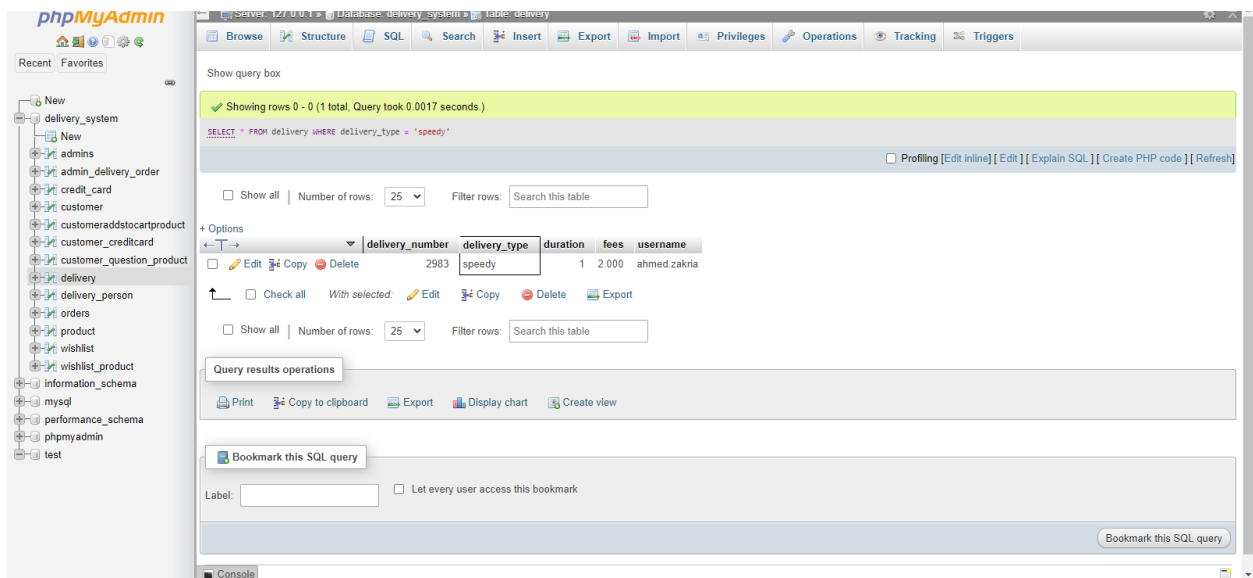

#### Selection

## v. Select from delivery 'speedy' delivery\_type

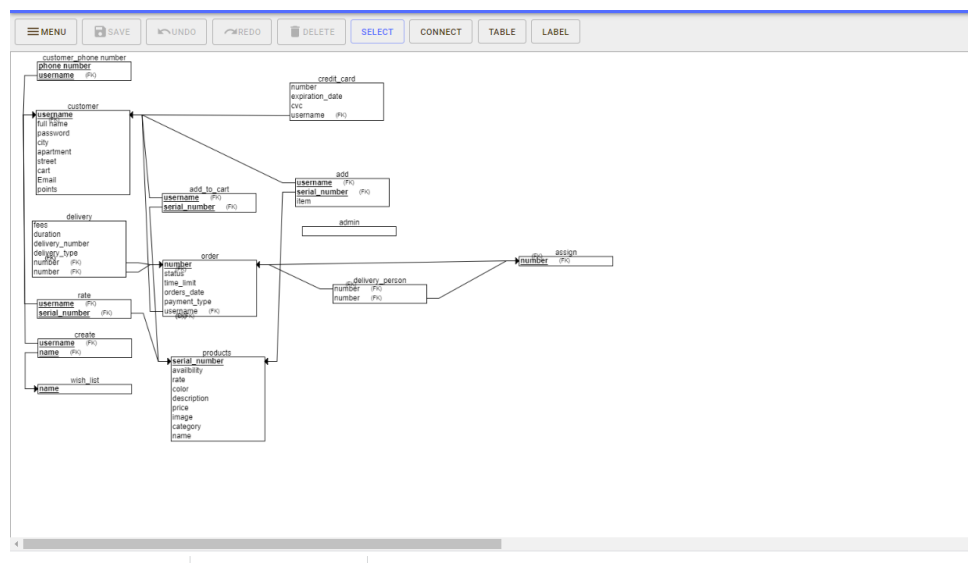

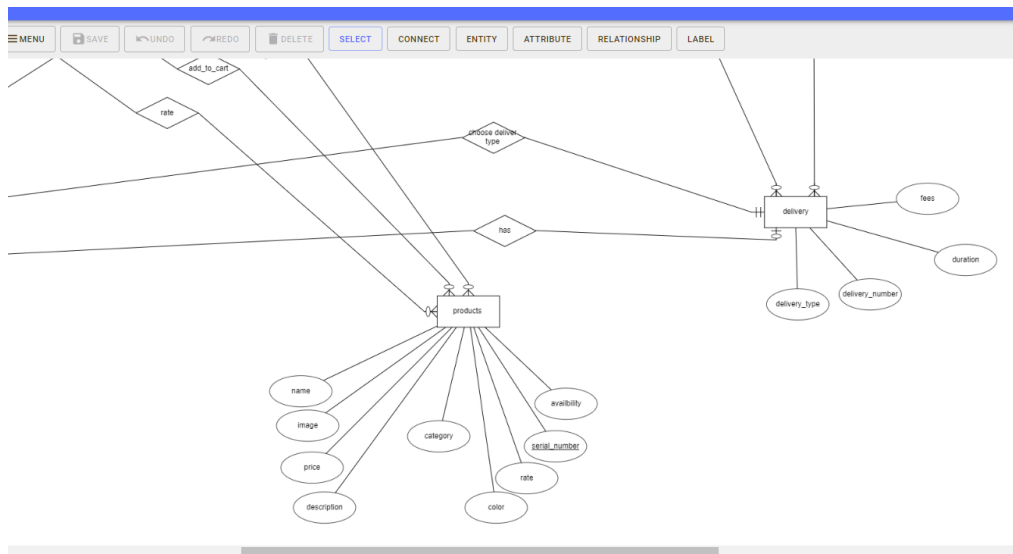

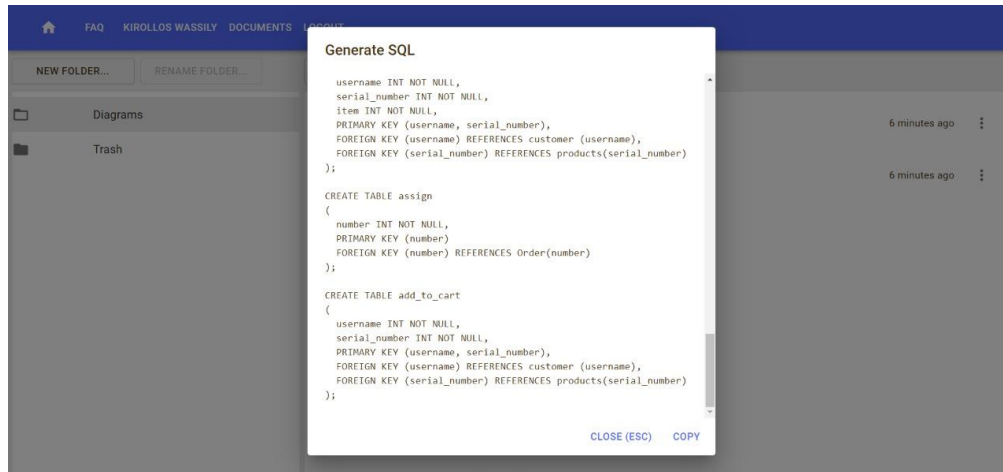

## Selection

## 7. Implementation:

1. ERD Plus is a database modeling tool for creating Entity Relationship Diagrams, Relational Schemas, Star Schemas, and SQL DDL statements. ERD Plus is a web-based database modelling tool that lets you quickly and easily create).

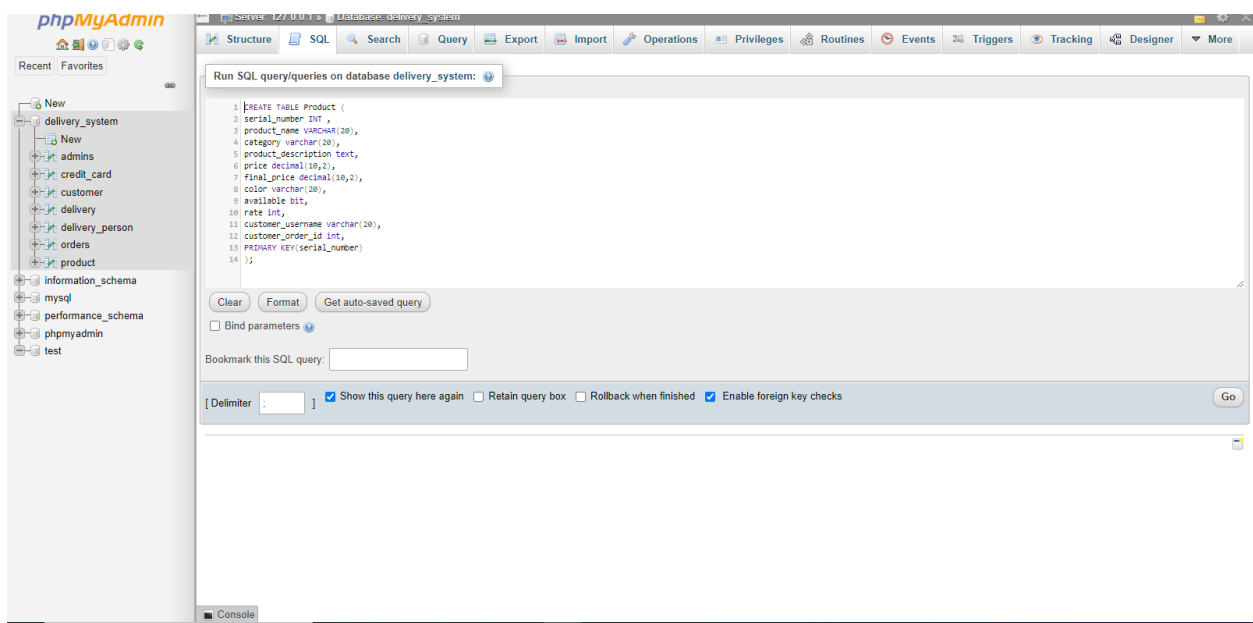

2. phpMyAdmin is a free online software tool written in PHP, supposed to deal with the management of MySQL over the Web.

### a. The samples

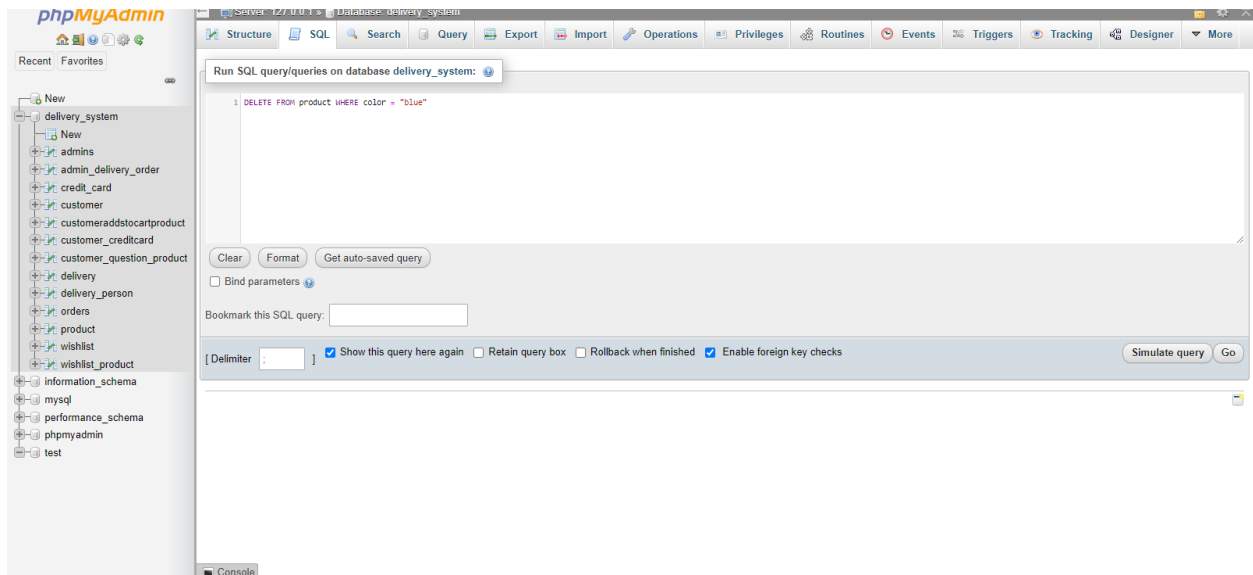

#### i. Sample of create

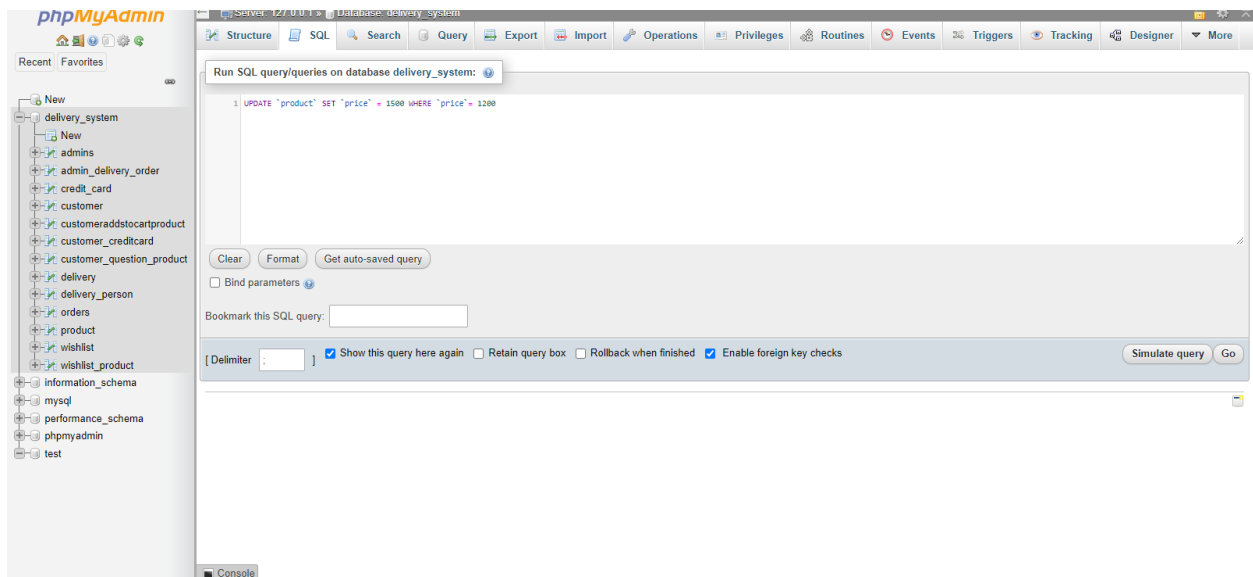

## ii. Sample of insert

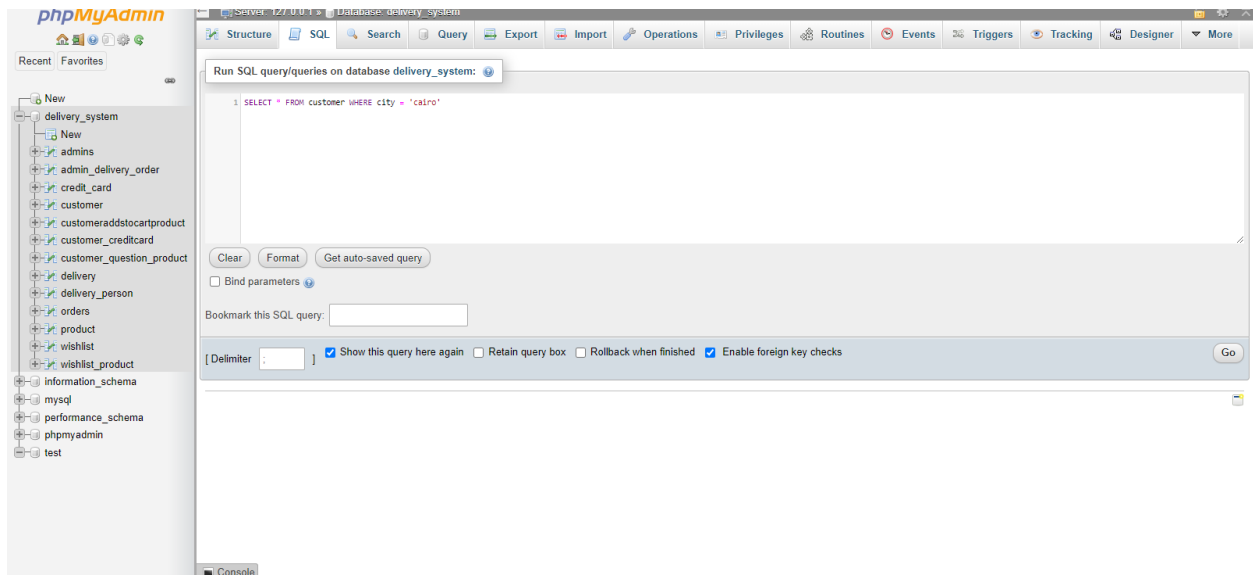

## iii. Sample of delete

#### iv. Sample of update

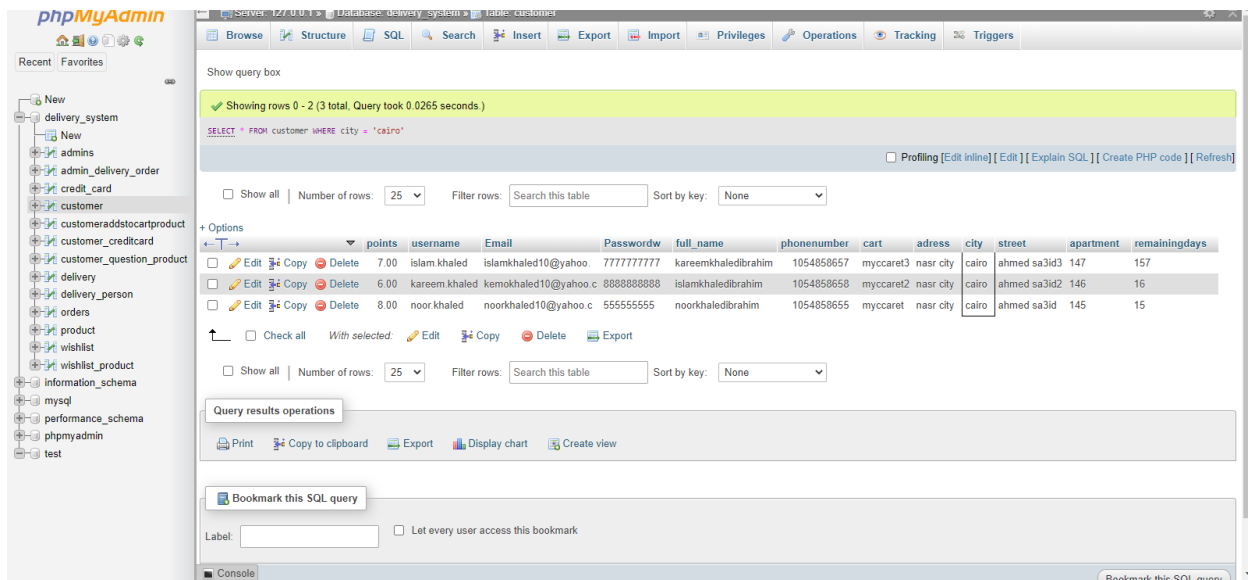

#### v. Sample of selection

## Selection

The screenshot shows the phpMyAdmin web interface. On the left is a sidebar with a database tree structure. The main area displays a SQL query: `SELECT * FROM customer WHERE city = 'cairo'`. Below the query, it shows the results of the query, displaying rows 0 to 2 (3 total rows). The results are shown in a table with columns: points, username, Email, Password, full\_name, phonenumber, cart, address, city, street, apartment, and remainingdays. The table contains three rows of data. Below the table, there are options to check all, edit, copy, delete, and export. At the bottom, there is a section for bookmarking the SQL query, with a label field and a checkbox to let every user access this bookmark.

points	username	Email	Password	full_name	phonenumber	cart	address	city	street	apartment	remainingdays
